FORT EUSTIS, VIRGINIA 23604

A requirement to determine analytically the acceleration-time relationships for the cargo compartments of CV-2 and CV-7 aircraft, when subjected to various crash conditions, and to determine the effect of these relationships on a load-limited restraint system provides the basis for this report. The techniques used in this report represent a logical extension of previous, similar programs; in the absence of test-crash data, the results contained herein may be used with a high degree of confidence.

The excessive load-limiter displacements (2 to 16 feet) indicated for certain crash conditions considered in this report are judged to be operationally unacceptable by this activity. However, the load-limiter concept represents a significant safety and operational improvement over the conventional restraint devices for most of the crash conditions considered. This activity suggests that a trade-off study be conducted to determine the maximum safety that can be achieved by load-limited restraints commensurate with acceptable operational factors.

Since the Army no longer has operational responsibility for the CV-2 and the CV-7 aircraft, this activity has not planned further effort in the area of this report. However, results of this contract will be forwarded to the appropriate Air Force agency for consideration.

## SUMMARY

This report presents the findings of an investigation into the crash pulse of fixed-wing cargo aircraft and the resulting behavior of cargo restrained by load limiters.

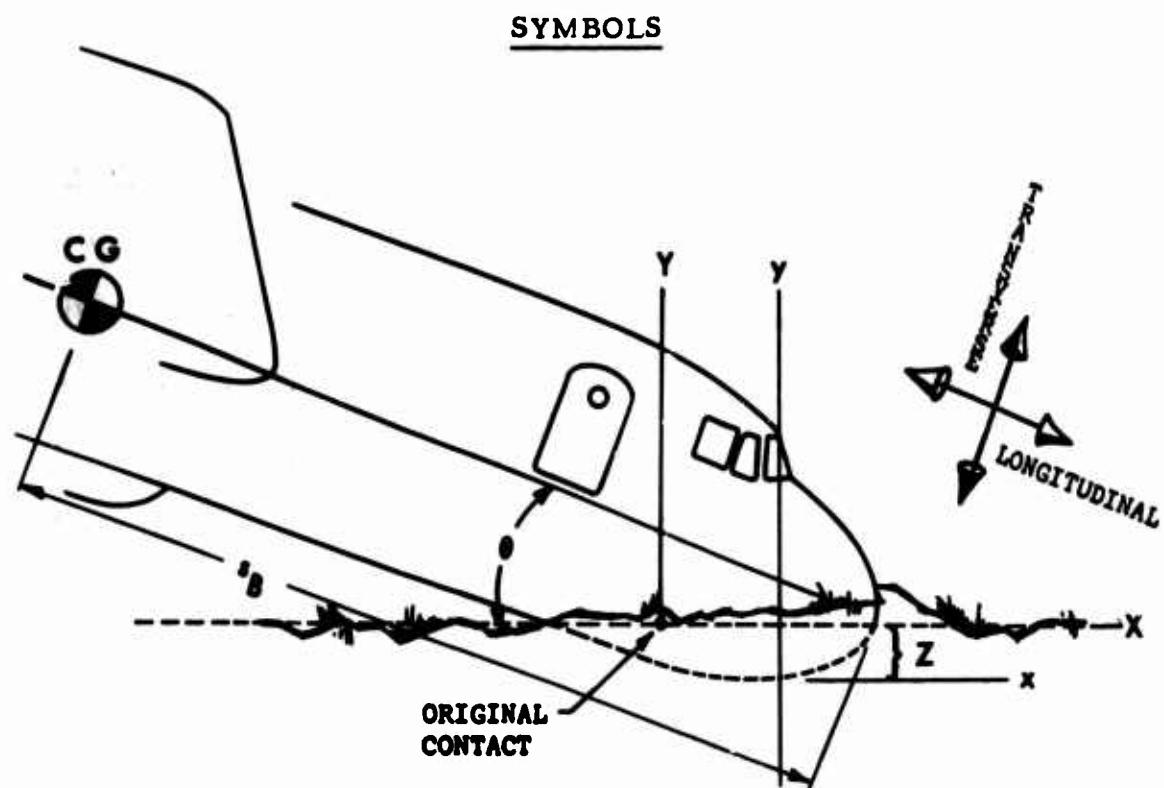

A crash pulse simulator computer program was developed that obtains acceleration-time histories at selected stations in the cargo compartment and under various crash conditions. This simulator was employed to obtain crash pulses for a wide range of input parameters, both for the CV-2 and the CV-7 Army aircraft. The resulting acceleration pulses were studied to determine a suitable spectrum of realistic pulses.

The crash pulse program was subsequently modified to include a routine that would simulate cargo dynamic behavior during the crash sequence, employing the floor acceleration data as it is developed. This latter program was applied to CV-2 and CV-7 aircraft, under significant crash conditions, to obtain the dynamic response of cargo to the crash pulse.

**Figure 1. Sketch Illustrating Symbols.**

$a_C$	Longitudinal acceleration of cargo ( $\text{ft/sec}^2$ )
$a_{FL}$ , $a_{FN}$	Longitudinal and normal accelerations respectively of cargo compartment floor ( $\text{ft/sec}^2$ )
$\bar{a}_i, a_i$	Rigid body acceleration components (transverse and longitudinal) at $i^{\text{th}}$ station ( $\text{ft/sec}^2$ )
$a_{\text{REL}}$	Relative cargo acceleration ( $\text{ft/sec}^2$ )
$a_{Ti}$	Total longitudinal acceleration at $i^{\text{th}}$ station ( $\text{ft/sec}^2$ )
$a_{Vi}$	Contribution to acceleration due to transverse vibration at $i^{\text{th}}$ station ( $\text{ft/sec}^2$ )
$A_{jk}$	Coefficients in polynomial expressions for functions of the angle $\theta$

B	Symbol for algebraic expression
C	Longitudinal component of ground reaction (lb)
$C_1 \dots C_4$	Soil parameters
$D_{XF}$	
$D_{YF}$	
$D_{XR}$	
$D_{YR}$	
Den	Symbol for algebraic expression
EI	Flexural rigidity of fuselage (lb-ft <sup>2</sup> )
f	Coefficient of friction between aircraft and ground
$f_C$	Coefficient of friction between cargo and cargo compartment floor
$F_N$	
$F_T$	
$F_{N1}$	
$F_{N2}$	Components of $F_N$ (lb)
$F_{N3}$	
$F_{T1}$	
$F_{T2}$	Components of $F_T$ (lb)
$F_{T3}$	
$F_{LL}$	Forward load-limiter limit acceleration (ft/sec <sup>2</sup> )
g	Symbol for algebraic expression
$G_1 \dots G_{10}$	Algebraic expressions

<b>G</b>	Symbols for unit of acceleration equivalent to 32.2 feet per second per second
$h_n(t)$	Symbol for expression, function of time
$H_1 \dots H_9$	Input parameters expressed as functions of the angle $\theta$
$I_A$	Mass moment of inertia of aircraft (slug ft <sup>2</sup> )
$I_F, I_R$	Mass moment of inertia of forward and of aft sections of aircraft
$k$	Reduction factor
$K_1$	Structural parameter
$L$	Length of fuselage (ft)
$m_A$	Mass of aircraft (slugs)
$m_F$ $m_R$	Mass of forward and of rear sections of aircraft (slugs)
$m_1 \dots m_4$	Generalized masses (for Lagrange's equations) (slugs)
$M_B$	Computed fuselage bending moment (ft-lb)
$M_H$	Yield hinge moment (ft-lb)
$P$	Transverse component of soil reaction force (lb)
$q_1 \dots q_4$	Generalized coordinates (for Lagrange's equations) (ft)
$Q_1 \dots Q_4$	Generalized forces (for Lagrange's equations) (lb)
$r$	Magnitude of space vector (ft)
$R_{LL}$	Rear load limiter limit acceleration (ft/sec <sup>2</sup> )
$s$	Distance from nose as an independent variable (ft)
$s_i$	Distance from nose to $i^{\text{th}}$ station (ft)

$s_B$	Distance from nose to center of gravity (ft)
$s_{BF}$	Distance from nose to center of gravity of forward and rear sections (ft)
$s_{BR}$	
$s_J$	Distance from nose to $J^{th}$ station (ft)
$S_C$	Scoop factor
$t$	Time (sec)
$v_{REL}$	Relative cargo velocity (ft/sec)
$x, y$	Coordinates of aircraft center of gravity from x, y axis system (ft)
$X, Y$	Coordinates of aircraft center of gravity from original point of contact (ft)
$X_F, Y_F$	Coordinates of centers of gravity of forward and rear sections, respectively (ft)
$X_R, Y_R$	
$X_H, Y_H$	Coordinates of yield hinge (ft)
$Z$	Interference of aircraft original contour with soil (ft)
$Z_G$	Actual penetration of ground by aircraft (ft)
$\dot{X}, \dot{Y}, \dot{Z}...$	Time derivatives of quantities X, Y, Z...
$\ddot{X}, \ddot{Y}...$	Second time derivatives of quantities X, Y...
$\beta$	Damping coefficient for longitudinal vibration
$\theta$	Angle of impact of aircraft (rad)
$\theta_F, \theta_R$	Attitude angle for forward and rear sections of aircraft, respectively (rad)
$\Delta t$	Time increment (sec)
$\Delta()$	Change in quantity () during time increment $\Delta t$

- $v_i$  Mass of  $i^{\text{th}}$  discrete segment of fuselage (slugs)  
 $v$  Mass per unit length of fuselage (slugs/ft)  
 $\phi_1 \dots \phi_4$  Normal mode shapes for free vibrations  
 $\omega_1 \dots \omega_4$  Natural angular frequencies (rad/sec)  
 $\bar{\omega}_1 \dots \bar{\omega}_4$  Resonant frequencies with damping (rad/sec)

#### SUBSCRIPTS

- $i$  Associated with  $i^{\text{th}}$  station or fuselage segment  
 $n$  Associated with  $n^{\text{th}}$  generalized coordinate in Lagrange's equations  
 $F$  Associated with forward section of aircraft  
 $R$  Associated with rear section of aircraft  
 $H$  Associated with yield hinge  
 $J$  Associated with  $J^{\text{th}}$  station

## INTRODUCTION

This report represents a continuation of the analytical investigation of acceleration-time pulses for the CV-2 and CV-7 aircraft as described in USAAVLABS Technical Report 65-30, "Cargo Restraint Systems for Crash Resistance". The crash impact parameters and limits thereof used in this program were felt to represent the conditions most likely to be encountered in an accident for the aircraft involved. In addition, it was felt that all of these conditions represented a survivable accident.

## CRASH PULSE SIMULATOR

### DESCRIPTION

The computer program to simulate dynamic behavior of a fixed-wing aircraft accepts as input (1) accident configuration variables, (2) structural data for the specific aircraft, and (3) soil behavior parameters. The accident configuration variables consist of velocity, sink rate, impact angle, and angular velocity (if present). The structural input data include flexural and axial stiffness properties, mass distribution data, buckling, yield and failure criteria, and various geometric data. The soil reaction parameters relate the interaction forces between aircraft and ground to the depth of penetration, the rate of penetration, and the horizontal velocity.

The simulator output is in the form of computer-plotted acceleration-time curves for three stations in the cargo compartment. Additionally, the simulator displays the maximum plowing depth, the groove length, the maximum values of generalized coordinates for vibration modes excited by crash forces, the maximum stresses in the fuselage, and the kinematic data at the completion of rebound (or slide-out).

### ANALYTICAL BASIS

The simulator operates in either of two general modes: the elastic mode or the plastic-hinge mode.

The elastic mode is assumed if fuselage (longitudinal) stresses are below buckling or plastic limits. In this mode the dynamic behavior of the aircraft is divided into two parts: First, the rigid body behavior is obtained from the soil-structure interaction forces and rigid body equations of motion. Second, the vibration modes excited both by the soil reaction forces and by the rigid body motion inertial forces are evaluated.

The vibration amplitudes are found by means of a normal mode analysis in which the first and second transverse and the first and second longitudinal modes of fuselage vibration are considered. The amplitudes of these four vibrational modes are taken as generalized coordinates in Lagrange's equations of motion for the aircraft. For the assumption that the damping coefficient is proportional to mass distribution along the

fuselage (an assumption which introduces little error), the Lagrange's equations reduce to a set of independent one-degree-of-freedom equations:

$$\ddot{q}_n + \beta \dot{q}_n + \omega_n^2 q_n = \frac{Q_n}{m_n}$$

where

$q_n, \dot{q}_n, \ddot{q}_n$  = generalized coordinates and time derivatives

$\beta$  = damping coefficient

$\omega_n$  = natural angular frequency

$Q_n$  = generalized force

$m_n$  = generalized mass

$$Q_n(t) = \int_0^L p(x, t) \phi_n(x) dx + \sum P_i(t) \phi_n(x_i)$$

$$m_n = \int_0^L u \phi_n^2 dx$$

A solution satisfying initial conditions is found in the convolution integral:

$$q_n(x, t) = \frac{1}{m_n \bar{\omega}_n} \int_0^L Q_n(\tau) \exp \left[ -\frac{\beta}{2}(t-\tau) \right] \sin \bar{\omega}_n(t-\tau) d\tau$$

which is evaluated numerically in the simulator program (reference Appendix I). With the generalized coordinates evaluated, the vibrational kinematics are determined and may be superimposed on the rigid body kinematics to obtain resultant accelerations. The maximum bending stresses are determined from the bending moments associated with the transverse vibrational modes of the fuselage.

The plastic-hinge mode of aircraft behavior is followed by the simulator, if at some fuselage station the effective buckling or the yield stress has been exceeded (when operating in the elastic mode). In the plastic-hinge mode, the aircraft is treated as two rigid bodies joined by a plastic "yield hinge" which may transmit hinge reactions as well as a plastic-hinge bending moment. In this mode, elastic vibrations are ignored, as they are con-

sidered to be negligible when compared with the large plastic deformations. Again, the equations of motion are solved by numerical integration.

The simulation is terminated by any of the following conditions:

1. The rebound has been completed; that is, the soil penetration has returned to zero.
2. The horizontal component of velocity has been reduced to zero.
3. The deflection angle at the plastic hinge has reached a critical value, implying a fuselage break.
4. The aircraft rotates outside a specified angular limit (implying an overturning).

A flow chart and an outline of computational operations of the simulator program are provided in Appendix I.

## DEVELOPMENT OF INPUT DATA

The input data for crash simulation of the CV-2 and CV-7 Army aircraft are divided into three categories: accident configuration variables, structural data, and soil reaction parameters. An example of input data for a simulation run as developed for the CV-7 aircraft appears in Appendix IV.

### ACCIDENT CONFIGURATION DATA

The accident configuration variables used were those specified in the contract statement of work.

### STRUCTURAL DATA

The mass distribution data have been obtained from weight analyses made by the manufacturer. These data were adjusted in accordance with various cargo and fuel level conditions for several simulator runs.

The structural stiffness data may be conveniently separated into two groups: that which deals with the vibrational behavior of the aircraft, and that which relates imposed forces to structural deformation.

Consider, first, the vibrational behavior. The mode shapes and natural frequencies (for both longitudinal and transverse vibrations) have been obtained by means of a separate computer program employing standard techniques (see Appendix VI, Program VIBRAT). Flexural rigidities, longitudinal stiffness, and mass distribution are the input to this auxiliary program; these input data have been obtained from analyses performed by the manufacturer. The output of the auxiliary program becomes input for the simulator program and consists of normal mode shapes, natural frequencies, generalized masses, and, for the transverse vibration, normalized bending stresses.

Next, consider the load deformation input parameters for the structure. A double modulus relationship has been postulated between crushing force and structural deformation in the local area of contact between the ground and the aircraft. The crushing force moduli have been obtained by computing average local plastic buckling loads for those structural members that fail by local instability and by adding an appropriate percentage for the resistance offered by bending of longitudinal members. Based upon observed behavior of a plastically deformed structure, an estimate has

been made of plausible "springback" deformation associated with unloading. A range of 10- to 20- percent springback was postulated for a 2- to 3- foot depth of structural crushing in the region of the underside of the nose. The springback is obtained in the simulator program by employing a greater modulus for unloading as well as for initial loading below a critical force (marking the onset of plastic crushing).

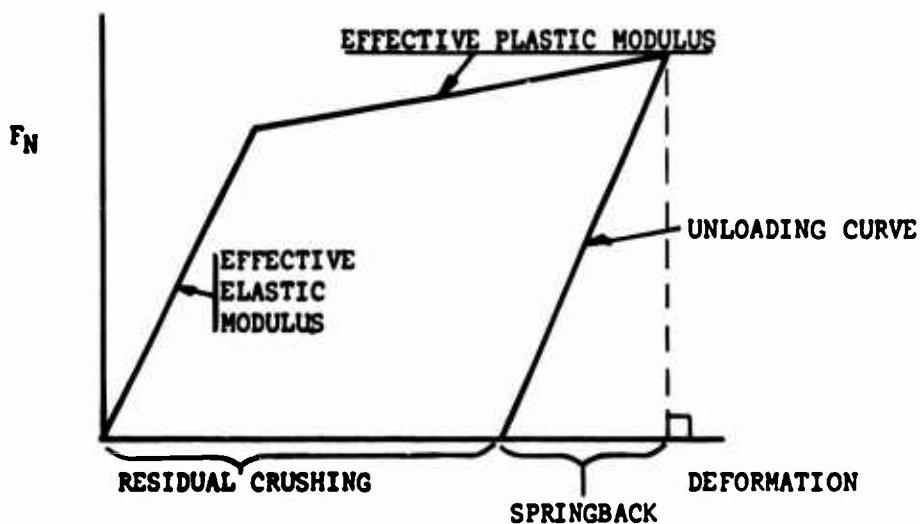

Figure 2. Plot of Normal Force Versus Structural Deformation

The onset of plastic crushing is signaled by a critical value of applied normal force (see Figure 2). This critical value is estimated considering those members that would first undergo general buckling; however, this value must also be consistent with the elastic modulus for deformation, the plastic modulus, and the assumed points through which the curves must pass.

The simulator program computes compressive bending stresses along the top of the fuselage for each time increment. When a critical effective buckling stress is reached at a given station, a "yield hinge" is considered to be formed in the fuselage and the mode of simulation changes. The critical fuselage buckling stress has been computed on the basis of the critical stress for a longitudinally stiffened curved panel. The computed value has been increased by an estimated factor to account for the dynamic overload capability associated with short-duration pulses and redistribution of stress as a plastic hinge is formed.

Once a yield hinge forms, a plastic-hinge moment offers substantially constant resistance to further bending at the hinge. This plastic-hinge moment has been computed on the basis of resistance offered to continuation of buckling and crushing of skin and longitudinal members.

In addition to the structural data described above, geometric input defining the longitudinal contour of the underside of the fuselage is required. These data were obtained from scale drawings provided by the manufacturer.

#### GROUND PARAMETERS

It should be noted that an accident can occur in a wide variety of soils whose properties may vary considerably. Consequently, the ground parameters were varied over practical ranges for a number of simulator runs.

The normal soil reaction force,  $F_N$ , was considered to be composed of several components. First, the essentially elastic behavior provides a contribution that increases with penetration. However, as both surface contact area and ground resistance per unit area are roughly proportional to depth of penetration, the assumed relationship is:

$$F_{N1} = C_1 Z_G^2$$

where

$Z_G$  = ground penetration

$C_1$  = soil elastic modulus

The constant  $C_1$  has been estimated for a typical soil.

A second contribution to normal force is associated with the phenomenon of planing (hydroplaning) is associated both with horizontal velocity and depth of soil penetration. The relationship is:

$$F_{N2} = C_2 Z_G \dot{X}$$

where

$\dot{X}$  = horizontal component of aircraft velocity

$C_2$  = planing parameter

The planing coefficient  $C_2$  has been roughly estimated for various soils, based upon momentum exchange and soil compressive resistance. The degree to which the nose of the aircraft remains a "plane" as opposed to

a "scoop" would further affect this parameter. In the computer simulation runs, a range of practical values was used for this parameter.

The third contribution to the normal force component is that of the direct momentum exchange effect. As the aircraft penetrates the ground, it accelerates soil mass to its velocity. A momentum exchange relationship leads to

$$F_{N3} = C_3 \dot{Z}_G^2 Z_G^2$$

where

$\dot{Z}_G$  = time rate of soil penetration

$C_3$  = soil impact parameter

The parameter  $C_3$  is approximately equal to the mass density of the soil multiplied by the contact area and divided by the penetration  $Z_G$ .

The total normal component is the sum of the three separate contributions:

$$F_N = F_{N1} + F_{N2} + F_{N3}$$

The tangential component of the soil reaction force is similarly composed of separate contributions. The first of these is simple friction.

$$F_{T1} = f F_N$$

where

$f$  = coefficient of friction

To the extent that the soil has been penetrated and some manner of scoop has been formed at the nose of the aircraft, two additional contributions to the tangential force would exist. The first of these is associated with soil "drag" or "plowing" action and is proportional to the horizontal velocity and ground penetration:

$$F_{T2} = C_4 X Z_G$$

The plowing coefficient for a given soil can only be determined experimentally. For this purpose a simple experiment was designed and conducted to provide a rough separation of the plowing and friction phenomena with two extremes of scoop conditions. The results of this

experiment were employed to provide order-of-magnitude values for the soil reaction parameters  $f$ ,  $C_2$ , and  $C_4$ . The experiment is described in Appendix III. The other contribution associated directly with the scoop effect is the horizontal momentum exchange. It would thus vary with soil penetration and with the velocity squared; that is,

$$F_{T3} = C_5 \dot{x}^2 z_G$$

The coefficient  $C_5$  would depend upon effective scoop area and soil density and has been roughly computed. In simulation runs, this parameter will be varied considerably to simulate conditions ranging from a definite scoop in a freshly plowed field to the other extreme of planing over hardpan soil or a concrete ramp. The total tangential force is then the sum of the individual contributions:

$$F_T = F_{T1} + F_{T2} + F_{T3}$$

## APPLICATION OF CRASH PULSE SIMULATOR

The CV-2 and CV-7 aircraft crash pulses were developed by the simulator program for combinations of the following parameters: velocity, sink rate, attitude angle at impact, soil conditions, and aircraft weight conditions.

1. Velocity was varied from 80 to 120 feet per second.
2. Sink rate was varied from 10 to 30 feet per second.
3. Attitude angle was varied from 3 to 15 degrees.
4. Two basic soil conditions were considered: hardpan, and a soft soil equivalent to a cultivated field.
5. For each aircraft, two weight conditions were considered: operational light and operational heavy.

A summary of significant results is contained in the following tables, which relate maximum cargo compartment acceleration (excluding short-duration peaks), time duration of pulse, and velocity change to the various input parameters.

An example input to the simulator program and developed output is contained in Appendix IV.

TABLE I  
RESPONSE TO IMPACT VELOCITY

Velocity (ft/sec)	Soil Condition	Maximum Acceleration (G)	Pulse Duration (sec)	Velocity Change (ft/sec)
80	Hardpan	6.1	.138	12

## CARGO SIMULATOR

### DESCRIPTION

The computer program to simulate cargo restraint systems is designed to obtain the dynamic response of a cargo retention system (employing load limiters) to an applied acceleration pulse. The cargo simulation is accomplished not as a separate computer program but rather as a subroutine appended to the crash pulse simulator program. As the specific crash pulse is generated, it becomes input (internally) to the cargo simulation subroutine.

### MATHEMATICAL MODEL

The cargo is assumed to rest on the cabin floor (with a suitable friction coefficient between cargo and floor), restrained fore and aft by load limiters as illustrated in Figure 3.

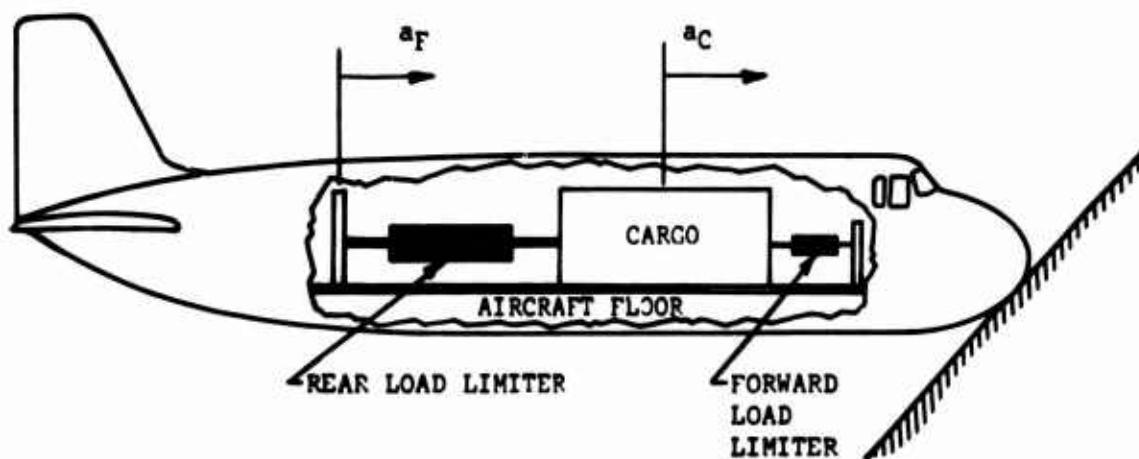

Figure 3. Cargo Restraint by Load Limiters

Each load limiter provides unidirectional restraint; the aft load limiter, for example, offers restraint to forward displacement of the cargo relative to the floor (when slack is taken up).

The longitudinal force applied to the cargo is transmitted from the aircraft through either the aft or the forward load limiter, as well as through the cargo floor by means of friction. The maximum value that this force may assume is the load-limiter limit force plus the coefficient of friction times the normal force between floor and cargo. (The normal floor force, in turn, depends upon the normal component of floor acceleration.)

At each time increment, the subroutine accepts as input the generated acceleration components (longitudinal and normal) of the floor at the cargo location. For the case of zero relative velocity (of cargo to floor), the cargo mass times the longitudinal acceleration is compared with the computed maximum possible longitudinal force. If the former is less than the computed limiting value, no relative acceleration occurs. Otherwise, the cargo acceleration is the computed limiting longitudinal force divided by cargo mass. The resulting relative acceleration is then the difference between the floor acceleration and the absolute cargo acceleration.

For the case in which the cargo has a relative velocity, the applied cargo force becomes the load-limiter load plus the computed friction force (assuming tie-down slack is not present). Again, the applied cargo force determines the absolute cargo acceleration and in turn the relative acceleration.

Numerical integration of the kinematic relationships is used to obtain relative cargo velocity and displacement (at each time increment) from the above-computed relative acceleration. The load-limiter stroke is finally obtained as the maximum cargo displacement.

A flow chart and computational relationships for the cargo simulation subroutine are given in Appendix II.

### APPLICATION OF CARGO SIMULATION PROGRAM

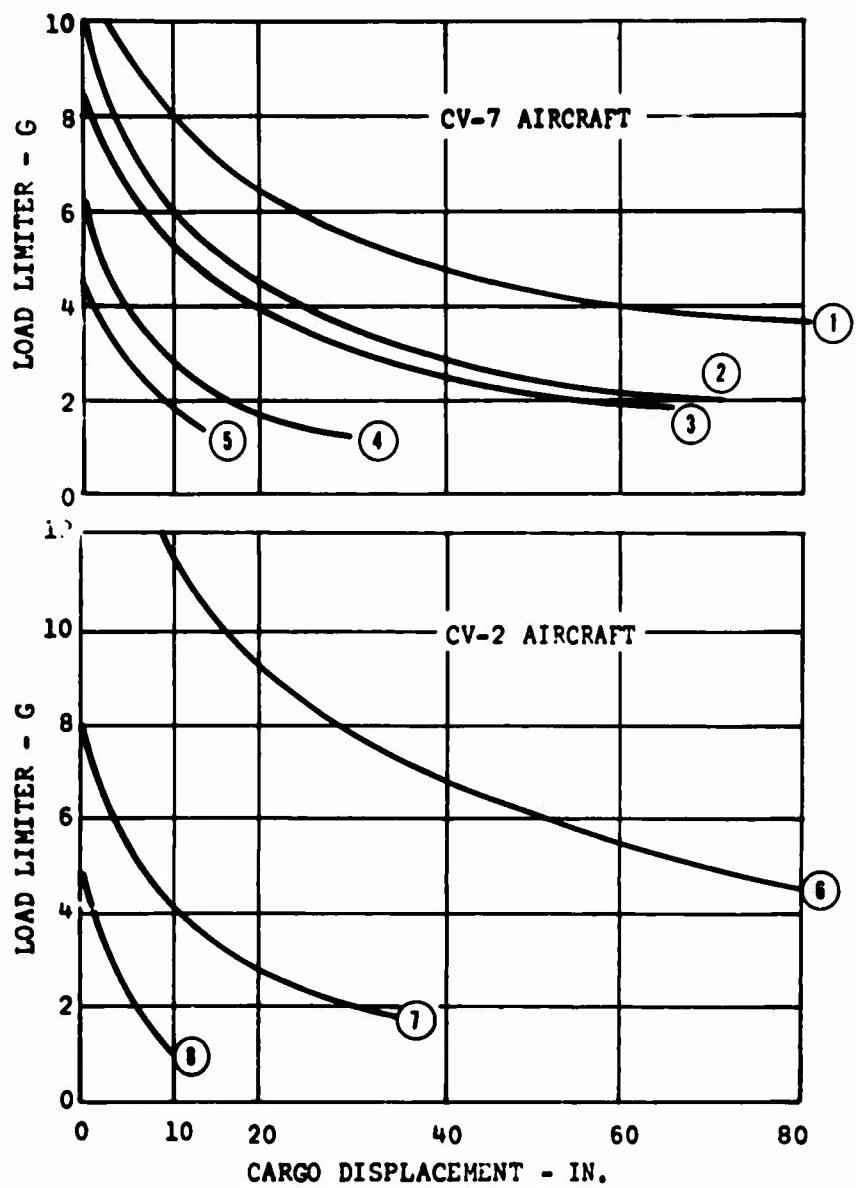

The cargo simulation program was employed for ten representative crash pulses (as shown in Table IV). For each pulse, the load-limiter stroke was computed for five different load-limiter limit forces, corresponding to 2G, 4G, 6G, 8G, and 10G limiting accelerations. The resulting limiter strokes are tabulated in Table IV along with the input conditions for each simulation run. (The center of the cargo compartment was selected as a representative location.)

A family of curves showing load-limiting force versus cargo displacement appears in Figure 4.

Appendix V shows typical output sheets from the cargo simulation program.

Figure 4. Plots of Load-Limiter Force Versus Cargo Displacement

## RESULTS

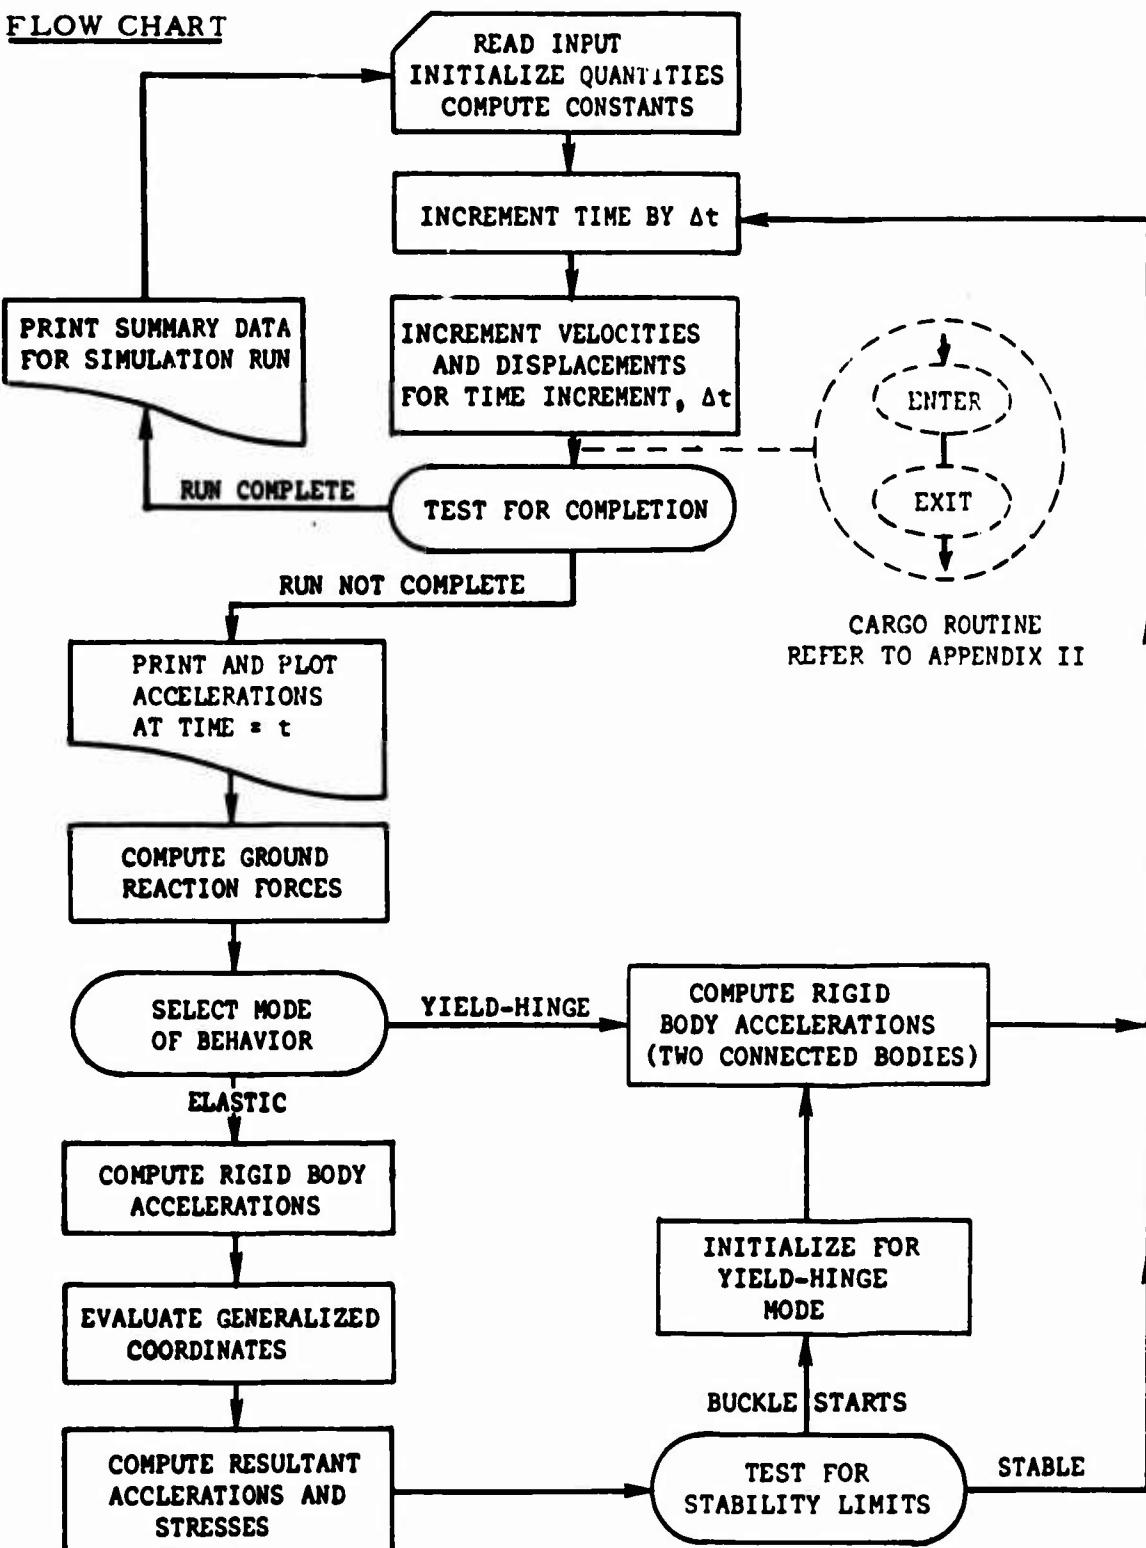

The investigation has led to the development of a crash pulse computer simulator (Appendix IV) providing an analytical tool for the study of crash pulse time histories of fixed-wing aircraft. This tool was applied to the CV-7 aircraft to obtain tabulated acceleration data (Tables I, II, III) for variations of pertinent input parameters, including soil conditions and accident configurations.

In addition, the investigation has led to the development of a cargo simulator program (Appendix V) to serve as an analytical tool to study cargo acceleration levels and displacements during a crash sequence. This simulator was applied to obtain tabular data and plots (Table IV and Figure 4) relating cargo displacements to load-limiter values for various crash conditions.

It should be pointed out that all of the acceleration-time pulses generated in this program fall within the human tolerance limits.

APPENDIX I  
CRASH PULSE SIMULATOR

FLOW CHART

**COMPUTATIONAL OPERATIONS (Refer to List of Symbols)**

1. Geometric, structural, and soil parameters that depend upon the angle  $\theta$  are computed as polynomials:

$$H_n = A_{n1} + A_{n2} \theta + A_{n3} \theta^2 + A_{n4} \theta^3$$

2. The coordinates  $x$  and  $y$  are found:

$$x = H_2 \sin \theta - (s_B - \frac{1}{H_1}) \cos \theta$$

$$y = (s_B - \frac{1}{H_1}) \sin \theta + H_2 \cos \theta$$

3. The interference,  $Z$ , and its time derivative,  $\dot{Z}$ , are found:

$$Z = Y - y , \quad \dot{Z} = \Delta Z / \Delta t$$

4. The normal force,  $F_N$  is computed:

- a. For positive  $Z$  and  $F_N$  less than critical  $F_{N\text{critical}}$ ,

$$F_N = K_1 (Z - Z_G)$$

where

$$Z_G = \sqrt{\frac{K_1}{g} Z + B^2 - B}$$

$$g = C_1 + (Z_G)^2 C_2$$

$$\dot{Z}_G = \Delta Z_G / \Delta t$$

$$B = \frac{(1 - S_C) H_8 X + K_1}{\dot{Z}_G g}$$

and

$$F_{N\text{critical}} = \frac{1 + 8\theta^2}{H_6}$$

$$K_1 = \frac{1 + 4\theta^2}{H_3}$$

$$C_1 = \frac{1 + 4\theta^2}{H_4}$$

$$C_2 = \frac{1}{H_5}$$

$S_C$  = scoop factor (varying from 0 to 1)

b. For  $F_N > F_N$  critical,  $Z$  positive,

$$\Delta F_N = k K_1 (\Delta Z - \Delta Z_G)$$

where

$$\Delta Z_G = \frac{\Delta Z}{[2gZ_G + (1 - S_C) H_8 X] k K_1 + 1}$$

$k$  = reduction factor for modulus  $K_1$

c. For  $Z$  negative,

$$\Delta F_N = K_1 (\Delta Z - \Delta Z_G)$$

where

$$\Delta Z_G = \Delta Z \frac{Z_G}{Z}$$

5. The tangential force is computed:

$$F_T = f F_N + S_C [H_8 \dot{X} + H_9 \dot{X}^2] Z_G$$

where

$f$  = effective coefficient of friction

6. Accelerations are computed:

$$\begin{aligned}\ddot{X} &= F_N / m_A, & \ddot{Y} &= F_T / m_A \\ \ddot{\theta} &= [F_N x + F_T (y + \frac{Z_G}{2})] / I_A\end{aligned}$$

where

$m_A$  = aircraft mass

$I_A$  = aircraft mass moment of inertia

7. Generalized forces for vibration modes are computed:

$$Q_1 = P \phi_1(s_J) + M \frac{d\phi_1}{ds}(s_J) - \sum_i \bar{a}_i u_i \phi_1(s_i)$$

$$Q_2 = P \phi_2(s_J) + M \frac{d\phi_2}{ds}(s_J) - \sum_i \bar{a}_i u_i \phi_2(s_i)$$

$$Q_3 = C \phi_3(s_J) - \sum_i a_i u_i \phi_3(s_i)$$

$$Q_4 = C \phi_4(s_J) - \sum_i a_i u_i \phi_4(s_i)$$

where

$$P = F_N \cos \theta - F_T \sin \theta$$

$$C = F_T \cos \theta + F_N \sin \theta$$

$$M = C \left[ \left( y + \frac{Z_G}{2} \right) \sin \theta + x \cos \theta \right]$$

$\phi_1 \dots \phi_4$  = normalized vibration modes as functions of s

$s_J$  = distance along fuselage axis to center of force application (from nose)

$\bar{a}_i, a_i$  = rigid body acceleration components (transverse and longitudinal at station  $s_i$ )

$u_i$  = mass associated with  $i^{\text{th}}$  finite subdivision of fuselage

8. Generalized coordinates are evaluated:

$$q_n(t + \Delta t) = \exp(-\frac{\zeta}{2} \Delta t) \left\{ q_n(t) \cos \bar{\omega}_n \Delta t + \left[ h_n(t) + \frac{Q_n(t) \Delta t}{m_n \bar{\omega}_n} \right] \sin \bar{\omega}_n \Delta t \right\}$$

where

n = varies from 1 to 4

$\zeta$  = damping coefficient

$$m_n = \text{generalized mass} = \int_0^L u \phi_n^2 dx$$

$$\bar{\omega}_n = \sqrt{\omega_n^2 - \frac{\beta^2}{4}}$$

$\omega_n$  = natural frequency

and  $h_n(t)$  is found from:

$$h_n(t + \Delta t) = \exp\left(-\frac{\beta}{2}\Delta t\right) \left\{ \left[ h_n(t) + \frac{Q_n(t) \Delta t}{m_n \bar{\omega}_n} \right] \cos \bar{\omega}_n \Delta t - q_n(t) \sin \bar{\omega}_n \Delta t \right\}$$

9. The bending moment is computed:

$$M_B(s_i) = EI(s_i) \left[ q_1 \frac{d^2 \phi_1}{ds^2}(s_i) + q_2 \frac{d^2 \phi_2}{ds^2}(s_i) \right]$$

where

$EI(s_i)$  = Flexural rigidity at  $s = s_i$

10. The longitudinal acceleration is computed

$$a_{Ti} = a_i + a_{Vi}$$

where

$a_{Ti}$  = total longitudinal acceleration at  $s = s_i$

$a_i$  = rigid body acceleration at  $s = s_i$

$a_{Vi}$  = relative acceleration from longitudinal vibration

$$a_{Vi} = q_3 \frac{d^2 \phi_3}{dt^2}(s_i) + q_4 \frac{d^2 \phi_4}{dt^2}(s_i)$$

11. Components of velocity and displacements are computed from kinematic relationships:

$$\Delta X = (\ddot{X} - \frac{\Delta \dot{X}}{2}) \Delta t$$

where

$\ddot{X}$  = updated acceleration (that is, acceleration at end of time interval,  $\Delta t$ )

$\Delta Y, \Delta \theta$  are found similarly.

$$\Delta X = (X - \frac{\Delta X}{2}) \Delta t$$

where  $X$  = updated velocity

$\Delta Y, \Delta \theta$  are found similarly.

12. For the "yield-hinge" mode of aircraft deformation, rigid body accelerations are computed as follows: The angular acceleration,  $\ddot{\theta}_F$ , of the forward portion of the aircraft and the angular acceleration,  $\ddot{\theta}_R$ , of the rear portion (aft of the yield hinge) are each computed:

$$\ddot{\theta}_F = \frac{G_3 \cdot G_5 - G_2 \cdot G_6}{Den}$$

$$\ddot{\theta}_R = \frac{G_1 \cdot G_6 - G_3 \cdot G_4}{Den}$$

where

$$G_1 = \left( \frac{I_F}{m_F} + \frac{m_R}{m_A} r_F^2 \right) \frac{m_A}{m_F}$$

$$G_2 = G_1 \frac{m_R}{m_F}$$

$$G_3 = \frac{M_H m_A}{m_R m_F} + F_n \left( \frac{x_H m_A}{m_F^2} + \frac{D_{XF}}{m_F} \right)$$

$$+ F_T \left[ \frac{\left( y_H + \frac{z}{2} \right) m_A}{m_F^2} - \frac{D_{YF}}{m_F} \right] + \frac{m_R}{m_F} G_D$$

$$G_4 = D_{XF} \cdot D_{XR} + D_{YF} \cdot D_{YR}$$

$$G_5 = \left( \frac{I_R}{m_R} + \frac{m_F}{m_A} r_R^2 \right) \frac{m_F}{m_A}$$

$$G_6 = -\frac{M_H m_A}{m_R m_F} - F_n \frac{D_{XF}}{m_F} + F_T \frac{D_{YR}}{m_H} + G_D$$

$$Den = G_1 \cdot G_5 - G_4 \cdot G_2$$

$$G_D = D_{XR}(D_{YF} \cdot \dot{\theta}_F^2 + D_{YR} \cdot \dot{\theta}_R^2) - D_{YR}(D_{XF} \cdot \dot{\theta}_F^2 + D_{YF} \cdot \dot{\theta}_R^2)$$

$I_F, I_R$  = mass moments of inertia

$m_A, m_F, m_R$  = masses

$X_H, Y_H$  = coordinates of yield hinge

$M_H$  = yield-hinge moment

$D_{XF} = X_F - X_H$

$X_F, Y_F$  = coordinates of forward center of gravity

$D_{YF}, D_{XR}, D_{YR}$  = similar to  $D_{XF}$

$$r_F^2 = D_{XF}^2 + D_{YF}^2$$

$$r_R^2 = \text{similar to } r_F^2$$

13. Acceleration components,  $\ddot{X}_F, \ddot{Y}_F, \ddot{X}_R, \ddot{Y}_R$ , of forward and aft section center of gravity are computed:

$$\ddot{X}_F = -\frac{F_T + m_R G_7}{m_A} - \frac{m_R}{m_A G_9}$$

$$\ddot{Y}_F = \frac{F_N - m_R G_8}{m_A} - \frac{m_R}{m_A G_{10}}$$

$$\ddot{X}_R = \frac{F_T - m_F G_7}{m_A} + \frac{m_F}{m_A G_9}$$

$$\ddot{Y}_R = \frac{F_N - m_F G_8}{m_A} + \frac{m_F}{m_A G_{10}}$$

where

$$G_7 = \dot{\theta}_F^2 D_{XF} + \dot{\theta}_R^2 D_{XR}$$

$$G_8 = \dot{\theta}_F^2 D_{YF} + \dot{\theta}_R^2 D_{YR}$$

$$G_9 = D_{YF} \cdot \ddot{\theta}_F + D_{YR} \cdot \ddot{\theta}_R$$

$$G_{10} = D_{YF} \cdot \ddot{\theta}_F + D_{YR} \cdot \ddot{\theta}_R$$

14. Velocity and displacement components are updated from kinematic relationships:

$$\dot{X}_F = (\ddot{X}_F - \frac{\Delta X_F}{2}) \Delta t$$

where

$$\ddot{X}_F = \text{updated acceleration}$$

$\Delta Y_F, \Delta \theta_F, \Delta X_R, \Delta Y_R, \Delta \theta_R$  are found similarly.

$$\Delta X_F = (\dot{X}_F - \frac{\Delta X_F}{2}) \Delta t$$

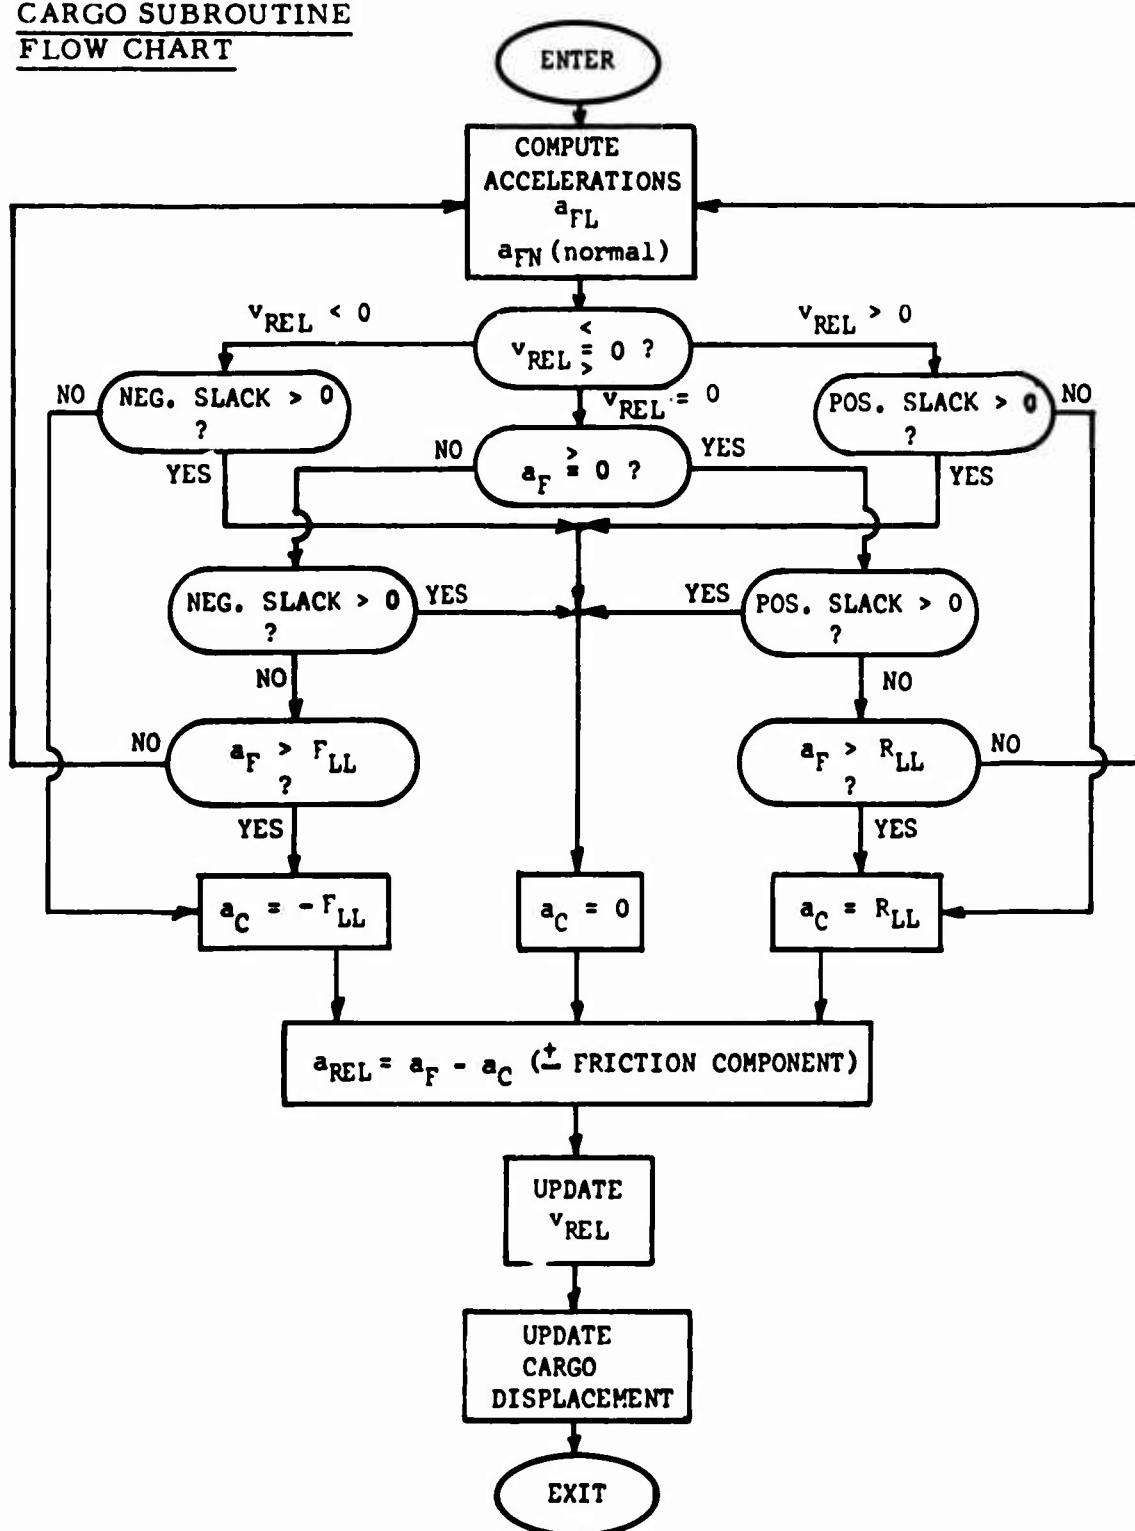

where

$$\dot{X}_F = \text{updated velocity}$$

$\Delta Y_F, \Delta \theta_F, \Delta X_R, \Delta Y_R, \Delta \theta_R$  are found similarly.

APPENDIX II  
CARGO SIMULATOR

CARGO SUBROUTINE  
FLOW CHART

## COMPUTATIONAL OPERATIONS FOR CARGO SUBROUTINE

1. Longitudinal acceleration is computed by crash pulse program.
2. Normal acceleration (augmented by an equivalent acceleration for weight) is computed:

$$a_{FN} = \ddot{X} \sin \theta + \ddot{Y} \cos \theta - \ddot{\theta} s_J + 32.2 \cos \theta$$

where

$s_J$  = Distance from center of gravity to the cargo location

3. If cargo relative velocity (relative to the floor) is zero at beginning of time interval  $\Delta t$ , cargo acceleration is computed as follows:

$$a_C = a_F \quad \text{for } (-F_{LL} - f_C a_{FN}) < a_F < (R_{LL} + f_C a_{FN})$$

$$a_C = -F_{LL} - f_C a_{FN} \quad \text{for } a_F < (-F_{LL} - f_C a_{FN})$$

$$a_C = R_{LL} + f_C a_{FN} \quad \text{for } a_F > (R_{LL} + f_C a_{FN})$$

where

$a_C$  = cargo acceleration

$a_F$  = floor acceleration (longitudinal)

$a_{FN}$  = Floor acceleration (normal)

$f_C$  = coefficient of friction between floor and cargo

$R_{LL}$  = rear load-limiter limit load (in the form of equivalent cargo acceleration)

$F_{LL}$  = forward load-limiter limit load (equivalent acceleration)

4. If the cargo has a relative velocity, cargo acceleration is computed as follows:

$$a_C = R_{LL} + f_C a_{FN} \quad \text{for } v_{REL} > 0 \text{ and no slack}$$

$$a_C = -F_{LL} - f_C a_{FN} \quad \text{for } v_{REL} < 0 \text{ and no slack}$$

5. If slack is present in system, the cargo acceleration is:

$$a_C = a_F \quad \text{for } -f_C a_{FN} < a_F < f_C a_{FN}$$

$$a_C = -f_C a_{FN} \quad \text{for } a_F < -f_C a_{FN}$$

$$a_C = f_C a_{FN} \quad \text{for } a_F > +f_C a_{FN}$$

6. The relative cargo acceleration is computed as:

$$a_{REL} = a_F - a_C \quad \text{with } a_{REL} \text{ taken positive in the forward direction but } a_F \text{ and } a_C \text{ positive in the aft direction.}$$

7. Relative velocity and relative displacement are computed by numerical integration:

$$\Delta v_{REL} = (a_{REL} - \frac{\Delta a_{REL}}{2}) \Delta t$$

$$\Delta s_{REL} = (v_{REL} - \frac{\Delta v_{REL}}{2}) \Delta t$$

where

$s_{REL}$  = relative (forward) displacement of cargo

$v_{REL}$  = relative (forward) velocity of cargo

APPENDIX III  
SOIL DRAG EXPERIMENT

An experiment designed to separate phenomena involved in the longitudinal resistance offered by the soil (during a crash) and to establish relative magnitudes of significant parameters was conducted using a typical clay-sand soil.

DESCRIPTION

An instrumented "shoe" was attached to the underside of a heavy cart. The cart was towed at various speeds over a trough of prepared soil, with the shoe set at a level for a given penetration of the soil. (See Figure 5.)

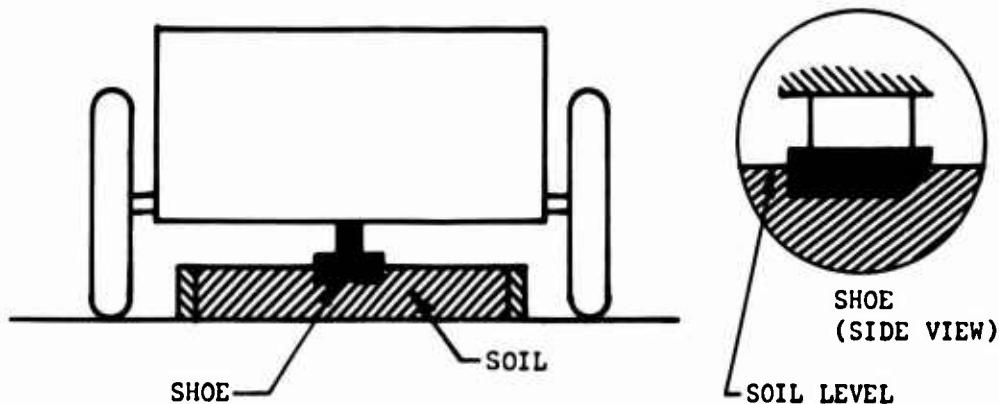

Figure 5. Soil Drag Experiment.

Instrumentation provided a history of normal and tangential forces for each run. Six runs were accomplished (and duplicated); they consisted of three velocities with the shoe orientated in each direction, i. e., with the sloped edge forward and the blunt edge forward.

The results are tabulated as follows:

TABLE V  
EXPERIMENTAL DATA

Velocity (fps)	Shoe Orientation	Tangential Force (lb)	Normal Force (lb)
4	Slope Forward	550	800
22	Slope Forward	520	700
38	Slope Forward	750	750
4	Blunt Forward	500	550
22	Blunt Forward	400	400
38	Blunt Forward	450	350

If a mathematical model for the tangential force is postulated as

$$F_T = f F_N + v A_s X,$$

ranges for the coefficients  $f$  and  $v$  may be computed consistent with the above data. These ranges are found to be:

$f$  varies from .3 to .9

$v$  varies from 10 to 46 (lb-sec/ft<sup>3</sup>)

where

$A_s$  is the total contact surface (ft<sup>2</sup>)

## INPUT NOTATION FOR COMPUTER PROGRAMS

### INPUT NOTATION

- A(I, J) - (I=1, 3; J=1, 4) Coefficients describing contour coordinates (ft)
- A(I, J) - (I=3, 9; J=1, 4) Coefficients describing ground-aircraft interaction
- AS(J) - Area of structural cross section ( $\text{ft}^2$ )
- BETA - Longitudinal vibration damping factor
- CDTH - Critical angle of plastic hinge rotation (rad)
- CIA - Mass moment of inertia of aircraft about "Y" axis (slug  $\text{ft}^2$ )
- CIM(J) - Mass moment of inertia per section (slug  $\text{ft}^2$ )
- CLN - Station for cargo attachment
- CMA - Total mass of aircraft (ft-lb)
- CMU(J) - Mass per section ( $\text{lb sec}^2/\text{ft}$ )
- CM(I) - (I=1, 4) Generalized masses ( $\text{lb sec}^2/\text{ft}$ )
- CNS, NS - Number of fuselage sections
- DF(J) - Fuselage depth from longitudinal axis (ft)
- DS - Length of a section (ft)
- DT - Time increment (sec)
- ECA(J) - Normalized stresses for first and second bending vibration modes ( $\text{lb}/\text{ft}^2$ )
- ECB(J) - Structural parameter ( $\text{lb}/\text{ft}$ )
- EI(J) - Flexural rigidity of fuselage ( $\text{lb ft}^2$ )

<b>EPS</b>	- Error factor
<b>FLL</b>	- Forward load-limiter limit acceleration (G)
<b>FMU</b>	- Friction coefficient
<b>MSW</b>	- Program switch code
<b>OM(J)</b>	- Frequencies of vibrations (rad/sec)
<b>PH1(J)</b> <b>PH2(J)</b> <b>PH3(J)</b> <b>PH4(J)</b>	- Normalized deflections of first and second vibration modes
<b>R LL</b>	- Rear load-limiter limit acceleration (G)
<b>RPM</b>	- Reduction factor to plastic-hinge moment
<b>SB</b>	- Location of center of gravity (ft)
<b>SNK</b>	- Sink velocity of aircraft (ft/sec)
<b>STRB</b>	- Buckling stress (lb/ft <sup>2</sup> )
<b>THT</b>	- Angle of impact (rad)
<b>THTD</b>	- Angular velocity (rad/sec)
<b>VEL</b>	- Velocity at aircraft (ft/sec)
<b>ZM(J)</b>	- Section moduli (ft <sup>3</sup> )

## INPUT DATA FOR CARGO SIMULATOR

### Aircraft - CV-7 (Operational Light)

The input data is the same as that for the crash simulator, (refer to Appendix IV) plus the following:

CLN = 13.

RLL = 8.

FLL = 4.

### Developed Data For Cargo Simulator

Same as for crash simulator, plus:

Maximum forward displacement of cargo  
relative to floor = 0.33 ft

## SIMULATOR PLOT OF CARGO AND FLOOR ACCELERATIONS

13. ABSTRACT

This report presents the findings of an investigation into the crash pulse of fixed-wing cargo aircraft and the resulting behavior of cargo restrained by load limiters.

A crash pulse simulator computer program was developed that obtains acceleration-time histories at selected stations in the cargo compartment and under various crash conditions. This simulator was employed to obtain crash pulses for a wide range of input parameters, both for the CV-2 and the CV-7 Army aircraft. The resulting acceleration pulses were studied to determine a suitable spectrum of realistic pulses.

The crash pulse program was subsequently modified to include a routine that would simulate cargo dynamic behavior during the crash sequence, employing the floor acceleration data as it is developed. This latter program was applied to CV-2 and CV-7 aircraft, under significant crash conditions, to obtain the dynamic response of cargo to the crash pulse.

<b>Aircraft Cargo Restraint</b> <b>Load Limiter</b> <b>CV-2, CV-7 Army Aircraft</b>							
INSTRUCTIONS							
<b>1. ORIGINATING ACTIVITY:</b> Enter the name and address of the contractor, subcontractor, grantee, Department of Defense activity or other organization (corporate author) issuing the report.		<b>10. AVAILABILITY/LIMITATION NOTICES:</b> Enter any limitations on further dissemination of the report, other than those imposed by security classification, using standard statements such as: <ul style="list-style-type: none"> <li>(1) "Qualified requesters may obtain copies of this report from DDC."</li> <li>(2) "Foreign announcement and dissemination of this report by DDC is not authorized."</li> <li>(3) "U. S. Government agencies may obtain copies of this report directly from DDC. Other qualified DDC users shall request through _____."</li> <li>(4) "U. S. military agencies may obtain copies of this report directly from DDC. Other qualified users shall request through _____."</li> <li>(5) "All distribution of this report is controlled. Qualified DDC users shall request through _____."</li> </ul> <p>If the report has been furnished to the Office of Technical Services, Department of Commerce, for sale to the public, indicate this fact and enter the price, if known.</p>					
<b>2a. REPORT SECURITY CLASSIFICATION:</b> Enter the overall security classification of the report. Indicate whether "Restricted Data" is included. Marking is to be in accordance with appropriate security regulations.		<b>11. SUPPLEMENTARY NOTES:</b> Use for additional explanatory notes.					
<b>2b. GROUP:</b> Automatic downgrading is specified in DoD Directive 5200.10 and Armed Forces Industrial Manual. Enter the group number. Also, when applicable, show that optional markings have been used for Group 3 and Group 4 as authorized.		<b>12. SPONSORING MILITARY ACTIVITY:</b> Enter the name of the departmental project office or laboratory sponsoring (paying for) the research and development. Include address.					
<b>3. REPORT TITLE:</b> Enter the complete report title in all capital letters. Titles in all cases should be unclassified. If a meaningful title cannot be selected without classification, show title classification in all capitals in parenthesis immediately following the title.		<b>13. ABSTRACT:</b> Enter an abstract giving a brief and factual summary of the document indicative of the report, even though it may also appear elsewhere in the body of the technical report. If additional space is required, a continuation sheet shall be attached.					
<b>4. DESCRIPTIVE NOTES:</b> If appropriate, enter the type of report, e.g., interim, progress, summary, annual, or final. Give the inclusive dates when a specific reporting period is covered.		It is highly desirable that the abstract of classified reports be unclassified. Each paragraph of the abstract shall end with an indication of the military security classification of the information in the paragraph, represented as (TS), (S), (C), or (U).					
<b>5. AUTHOR(S):</b> Enter the name(s) of author(s) as shown on or in the report. Enter last name, first name, middle initial. If military, show rank and branch of service. The name of the principal author is an absolute minimum requirement.		There is no limitation on the length of the abstract. However, the suggested length is from 150 to 225 words.					
<b>6. REPORT DATE:</b> Enter the date of the report as day, month, year; or month, year. If more than one date appears on the report, use date of publication.		<b>14. KEY WORDS:</b> Key words are technically meaningful terms or short phrases that characterize a report and may be used as index entries for cataloging the report. Key words must be selected so that no security classification is required. Identifiers, such as equipment model designation, trade name, military project code name, geographic location, may be used as key words but will be followed by an indication of technical context. The assignment of links, rules, and weights is optional.					
<b>7a. TOTAL NUMBER OF PAGES:</b> The total page count should follow normal pagination procedures, i.e., enter the number of pages containing information.							
<b>7b. NUMBER OF REFERENCES:</b> Enter the total number of references cited in the report.							
<b>8a. CONTRACT OR GRANT NUMBER:</b> If appropriate, enter the applicable number of the contract or grant under which the report was written.							
<b>8b, 8c, &amp; 8d. PROJECT NUMBER:</b> Enter the appropriate military department identification, such as project number, subproject number, system numbers, task number, etc.							
<b>9a. ORIGINATOR'S REPORT NUMBER(S):</b> Enter the official report number by which the document will be identified and controlled by the originating activity. This number must be unique to this report.							
<b>9b. OTHER REPORT NUMBER(S):</b> If the report has been assigned any other report numbers (either by the originator or by the sponsor), also enter this number(s).
